

Gabby—RGGA

Gabby started Removable Growth Guidance when she was 10 years old and worn her appliance for 8 months before having FRLAs placed to hold the growth while we waited for her adult teeth to erupt. Growth was achieved to allow space for the adult teeth to erupt into position and her airway volume improved from 77.9mm² to 270.2mm². While no fixed braces have been used at this stage, she has the option of either fixed orthodontics or Invisalign to make minor changes to the tooth position to achieve an ideal final cosmetic result.
